AI System Review Template

Nov 11, 2026 · @David Kerr Kelly

Purpose

An AI System is reviewed through the same workflow as a model and ends in the same signed report, which goes to the MRC. What changes is the questionnaire and the evidence behind it.

- **The owner** writes the brief and answers the 13 AI review questions on the record.
- **The reviewer** must be someone other than the owner. They give a verdict on each answer, agree each stage, and sign off.
- **The MRC** receives the report and decides the risk rating. It does not approve or reject the review itself.

Generative and agentic AI sit outside SR 26-2 model risk scope, so an AI System carries no SR 26-2 nine. Its questions are written against the FINOS AI risk catalogue instead, and its evidence comes from what the system has been measured to do: evaluations, stress tests, its variability envelope and traces.

How the review runs

The seven stages are the same as a model's, in the same order and setting the same review statuses. Only the third stage's name changes.

#	Stage	What is agreed for an AI System
1	Preliminary documents	The pack: design documentation, evaluation and stress-test results, the variability envelope, trace references, the provider contract
2	Assumptions	The assumptions register, e.g. that the provider does not retrain the pinned version
3	The AI review questions	A verdict on each of the 13 answers
4	Model weaknesses	The weaknesses register, together with the **failure-mode register**
5	Limitations of use	The limitations register, including what the system must not be used for

#	Stage	What is agreed for an AI System
6	Monitoring approach	The monitoring narrative, together with the **trigger thresholds** and fallback state
7	Remediation	What is outstanding, who owns it, by when

The rules are the same as for a model: an agreed stage can be reopened, every stage has a record of challenge that can't be edited, and sign-off is blocked while any stage is unagreed or any challenge is open.

The template, section by section

The report has the same seven parts as a model review. What changes is the AI-specific content in each.

Part	Section	What it contains for an AI System	Filled by
A	Identification	System ID and name; **foundation model, provider and pinned version**; version policy; hosting; deployment pattern; autonomy and governance intensity; human oversight mode; data sent for inference; EU AI Act class and who decided it; markets served; owner, reviewer, trigger, scope; tier, materiality, complexity; current risk rating; last review	Owner, platform
B	Documents reviewed	Each document and its version; the evaluation runs, stress-test suite version, envelope run and trace references the review relied on, each with its date	Owner, reviewer marks read
	Challenge in summary	Challenges raised, answered and open, by stage	Platform
C	The AI review questions	For each of the 13: owner's status and rationale, reviewer's verdict and comment, the evidence it rests on	Owner, then reviewer

Part	Section	What it contains for an AI System	Filled by
D	Findings	Assumptions; weaknesses and **failure modes** (FINOS risk, mitigation, what detects it, fallback); limitations of use; **tools and APIs** with their authority and approval rule; monitoring with **trigger thresholds** for correctness, consistency, robustness and predictability; remediation	Owner proposes, reviewer agrees
	Evidence coverage	For each of correctness, consistency, robustness and predictability: whether it rests on live evidence, is partly evidenced or is not evidenced, from the practice paper's nine concepts that this system's intensity requires	Platform
E	Reviewer's opinion	Fit for use / Fit with conditions / Not fit; the conditions as remediation items; recommended risk rating	Reviewer, at sign-off
F	Record and attestation	The full record of challenge, stage agreements, final commentary, who signed and when	Platform, reviewer

The evidence coverage section is the AI-specific addition. A reviewer accepting "Grounding and Accuracy" while correctness reads "not evidenced" should have to say why.

The AI review questions and their evidence

There are 13: five common questions asked of every ML Application and AI System, then eight specific to generative and agentic systems. A record keeps the wording it was registered with.

#	Topic	Question	Evidence the reviewer checks
1	Use Case	What decision or task does this support, and what is it explicitly not to be used for?	Use case field; Limitations of use stage

#	Topic	Question	Evidence the reviewer checks
2	Human Oversight	Who reviews what it produces, on what basis, and would they catch it being wrong?	Human oversight mode; tools register approval rules
3	Bias and Fairness	Who could be disadvantaged by its output, and how would you know?	Fairness register
4	Explainability	Can a particular output be explained to the person affected by it, and to a regulator?	Explainability approach; trace references
5	Drift and Monitoring	What would show that it has stopped working, and who is watching for it?	Monitoring stage; trigger thresholds; monitoring readings
6	Model Provenance	Which foundation model and version is in use, who provides it, and what happens when they change or retire it?	Foundation model, pinned version, version policy
7	Data Egress	What data is sent for inference, does it leave the firm, and what in the contract governs its retention and reuse?	Data egress class and contractual basis; provider contract
8	Grounding and Accuracy	How is the output grounded, how has its accuracy been measured, and against what reference answers?	Grounding field; evaluations; expert-grounded benchmark
9	Hallucination Exposure	What is the consequence of a confident but wrong answer reaching its consumer, and what stops it?	Failure modes; guardrails; human oversight
10	Determinism	Can the same input produce different output, and does anything downstream depend on it not doing so?	Variability envelope; sampling parameters

#	Topic	Question	Evidence the reviewer checks
11	Prompt and Input Integrity	Could untrusted content reach the model as instructions, and what filtering stands between the two?	Instruction hierarchy; guardrails; stress tests
12	Agency and Authority	What can this system do without a human, which tools or APIs can it call, and what is the worst it could do if manipulated?	Tools and APIs register; agentic failure modes
13	Regulatory Classification	Under the EU AI Act and any other applicable regime, what class does this system fall into, and who decided that?	EU AI Act class and rationale; derived regimes

Unlike a model's nine, no question asks for overall risk or independent validation. The reviewer's opinion (part E) gives the conclusion, and the review itself is the independent check.

How the review relates to the system's records

For a model, the owner's answers live in a core document. For an AI System, the record itself carries most of them, and the reviewer checks those fields and measurements rather than prose.

- **Answers on the record.** Fields such as foundation model, data egress, grounding, human oversight and EU AI Act class are the owner's answers to questions 2, 4 and 6–13. The questionnaire rationale should point at them, not restate them.
- **Measured evidence.** Evaluations, stress-test runs, the variability envelope and judge calibration are fixed once recorded. The report should name the run each verdict relied on, so a later reader can tell whether the evidence has since gone stale.
- **Envelope run counts.** The platform refuses to state an envelope from fewer runs than the minimum. A reviewer should treat a missing envelope as a finding, not as a gap to work around.
- **Mitigations.** Whether a FINOS mitigation is in place comes from documents tagged against the record, not from the failure-mode register. The reviewer checks the coverage view, not a status column.

- **No core document yet.** No AI System has a design document like the model documents in `docs/models`. If one is written, it should answer the 13 questions in this order, so the review can cite it section by section as it does for a model.

What exists today and what is still to build

An AI System already goes through the seven stages and gets a signed report. The report prints only the registers a model has, so most of the AI-specific evidence never reaches the MRC.

Part	Today	To build
A Identification	Record, owner, reviewer, trigger, sign-off	Foundation model, pinned version, version policy, hosting, deployment pattern, autonomy, oversight, data egress, EU AI Act class, risk rating
B Documents reviewed	Scope text only	Documents, plus the evaluation, stress-test, envelope and trace runs relied on
Challenge in summary	Live on main	—
C The AI review questions	Both sides on one row, under "The AI review questions"	The evidence reference per question
D Findings	Assumptions, weaknesses, limitations, monitoring narrative, remediation	Failure modes, tools and APIs, trigger thresholds
Evidence coverage	Shown on the record's screen, not in the report	Print the four properties and the concepts behind each
E Reviewer's opinion	Missing	Same as for a model: opinion, conditions, recommended rating
F Record and attestation	Live	—

Suggested order: part E once for all three record types, then the AI registers in D, then evidence coverage, then the identification fields in A.
