Model Review Template

Nov 11, 2026 · @David Kerr Kelly

Purpose

A model review is the independent reviewer's verdict on the model owner's account of the model. It runs on the platform as seven stages and ends in a signed **Model Review Report**, which goes to the Model Risk Committee (MRC).

- **The owner** writes the brief (why the review is happening, scope, due date) and answers the nine questions in the model's core documentation.
- **The reviewer** must be someone other than the owner. They give a verdict on each answer, agree each stage, and sign off.
- **The MRC** receives the report as evidence and decides the model's risk rating. It does not approve or reject the review itself.

A review starts for one of four reasons: Periodic, New version, Owner change or MRC directed.

How the review runs

The review runs in seven stages, in the order the work happens. The reviewer agrees each stage, and that agreement sets the model's review status.

#	Stage	What is agreed	Review status it sets
1	Preliminary documents	The pack the reviewer works from	Documents reviewed
2	Assumptions	The assumptions register: impact, monitoring, mitigation	Assumptions agreed
3	The nine questions	A verdict on each of the owner's answers	Questions answered
4	Model weaknesses	The weaknesses register	Weaknesses agreed
5	Limitations of use	The limitations register, with monitoring triggers and compensating controls	Limitations agreed
6	Monitoring approach	How the model will be watched in use	Monitoring agreed

#	Stage	What is agreed	Review status it sets
7	Remediation	What is outstanding, who owns it, by when	Remediation agreed

- **Assumptions come before the questions** because question 6 asks whether they are documented and justified.
- **Agreeing a stage does not lock it.** A reviewer can reopen an earlier stage, and reopening is recorded.
- **Each stage has a record of challenge.** Owner and reviewer post notes; a note can be marked a Challenge, which stays open until a later note answers it. Notes can't be edited or deleted.
- **Sign-off is blocked** while any stage is unagreed or any challenge is open. The reviewer then writes a final commentary and signs, which files the report against the model.

The template, section by section

The report has seven parts, in this order. Parts C and D are the seven stages; the rest frame them.

Part	Section	What it contains	Filled by
A	Identification	Model ID and name; **version under review** and documentation version; owner; reviewer and a statement of their independence; why this review; scope; expected completion; tier, materiality, complexity; **current risk rating**; date and opinion of the last signed review	Owner (brief), platform
B	Documents reviewed	Each document in the pack with its version, e.g. documentation v3.0, benchmark v0.2, sensitivities, test evidence. For a new version: confirmation that all three were updated	Owner, reviewer marks read

Part	Section	What it contains	Filled by
	Challenge in summary	Challenges raised, answered and open, in total and by stage, e.g. "4 challenges raised, 4 answered, 0 open"	Platform
C	The nine questions	For each: the owner's status and rationale, with a section reference to the documentation; the reviewer's verdict (Accepted / Challenged) and comment; the stage that holds the evidence	Owner, then reviewer
D	Findings	Assumptions; weaknesses and limitations of use, each with a severity and the question it came from; monitoring approach; remediation items, each with owner, priority, due date, status and the finding it closes	Owner proposes, reviewer agrees
E	Reviewer's opinion	**Fit for use / Fit for use with conditions / Not fit for use**; the remediation items any conditions depend on; the reviewer's recommended risk rating for the MRC	Reviewer, at sign-off
F	Record and attestation	The full record of challenge under each stage, who agreed each stage and when, the final commentary, who signed and when	Platform, reviewer

Part E exists because the platform's nine questions have no "overall risk" question. The review must state its conclusion somewhere, and the opinion is that place.

The nine questions and their evidence

The canonical nine are the platform's SR 26-2 set, seeded on every model at registration. Each verdict rests on evidence held in a stage or in the documentation, so nothing is asked twice.

#	Topic	Question	Evidence the reviewer checks
1	Ronseal Test	Does the model do what it says on the tin?	Documentation purpose and scope; Limitations of use stage
2	Accuracy & Stability	Does the model provide timely, accurate and stable results?	Sensitivities and backtests in the documentation; the benchmark
3	Resource Usage	Does the model consume excessive computational resources?	Documentation's computational-complexity section
4	Override Controls	Are there controls over manual overrides?	Documentation; compensating controls on limitations
5	Data Quality	Is the input data accurate, complete and appropriate?	The model's data sources and lineage
6	Assumptions	Are the model's assumptions documented and justified?	**Assumptions stage**
7	Limitations	Are the model's limitations understood and monitored?	**Limitations and Monitoring stages**
8	Benchmarking	Has the model been benchmarked against credible alternatives?	Benchmark document, e.g. the Wolfram oracle
9	Independent Validation	Has the model been independently validated?	This review, and any external validation on file

For questions 6 and 7 the verdict and the stage are one judgement. A reviewer who agrees the Assumptions stage and then challenges question 6 has contradicted themselves, so the two should be settled together.

An owner can mark a question Addressed while the reviewer marks it Challenged. The report shows both on one row, because that disagreement is the review doing its job.

How the review relates to the core documentation

The core documentation is where the owner answers the nine questions; the review is where the reviewer judges those answers. That only works if both use the same nine, and today they don't.

Documents	Questions they answer	Gap to the platform's nine
MKM-MP-001, MKM-PR-001, MKM-SG-001	Q1–4 as the platform; then Output Consumption, Model Chaining, Weaknesses, Monitoring, Overall Risk	Q5–9 differ
MKM-DE-001	Ronseal, Methodology, Alternative Methods, Assumptions, Data Quality, Model Chaining, Weaknesses, Monitoring, Overall Risk	Most differ
MKM-SS-001 v3.0, MKM-SP-001 v2.0	Purpose, Conceptual Soundness, Data Quality, Developmental Evidence, Outcomes Analysis, Ongoing Monitoring, Benchmarking, Implementation, Overall Risk	All differ in wording
MKM-DD-001, MKM-EF-001, MKM-FPO-001	None	No section at all

The proposal is to rewrite each document's validation-questions section to the platform's nine at its next version change. The questions the documents answer that the platform's set doesn't ask move to where the template already covers them:

- **Overall Risk** → the reviewer's opinion (part E)
- **Weaknesses**, **Monitoring** → their review stages
- **Model Chaining** → the model's dependencies register
- **Output Consumption** → the use case

Models already registered keep the questions they were seeded with; this changes what the documents answer, not what the platform stores.

What exists today and what is still to build

The seven stages, the verdicts, the record of challenge and the signed report are all live; parts A, B and E are the gaps.

Part	Today	To build
A Identification	Record, owner, reviewer, trigger, sign-off	Version under review, documentation version, risk rating, last review
B Documents reviewed	Scope text only	A list of documents and their versions
Challenge in summary	Written on a branch, not yet merged	Merge
C The nine questions	Both sides on one row	Section reference to the documentation
D Findings	All five registers. Remediation fixed on the branch: it printed a blank Action column	Severity on findings; links from findings to questions and from remediation to findings
E Reviewer's opinion	Missing	Opinion, conditions and recommended rating, captured at sign-off
F Record and attestation	Live. Stage numbering fixed on the branch: it started at 0	—

Suggested order: merge the branch fixes, then add A and B (report only, the data is already on the record), then E (sign-off form, endpoint and report together), then the links in D, then reissue each document as it next changes version.
